Author Index 499
Subject Index 501

This book presents a balanced treatment of the principles of molecular spectroscopy and of their use in the determination of molecular structure and in chemical analysis. Beginning with an introduction which develops theoretical principles involving classical concepts of radiation, wave mechanics and symmetry, the book describes the principles, instruments and experimental methods of electronic (ultraviolet and visible), vibrational (infrared and Raman) spectroscopy, nuclear magnetic resonance and mass spectroscopy. Each chapter, dealing with one of these branches of spectroscopy, is divided into three sections covering principles, instrumentation and, finally, experiments designed to illustrate the topics in the principles and instrumentation sections.

Contents

Introduction. Electronic spectroscopy. Vibrational spectroscopy. Nuclear magnetic resonance. Mass spectrometry. Tables of units. List of experiments. Author index. Subject index.

Quantum Optics

PROCEEDINGS OF THE INTERNATIONAL SCHOOL OF PHYSICS "ENRICO FERMI"

VARENNA ITALY

COURSE 42

Edited by **R. J. Glauber**
Harvard University
Cambridge, Massachusetts

This book presents a comprehensive and detailed investigation into the fundamental physics underlying optics. It deals not only with light propagation but also with the way in which light is radiated, its interaction with matter, and its detection. An attempt is made to characterize the fields radiated by coherent radiators, such as the laser, in the most detailed terms in which the quantum theory allows.

Since the development of the laser, the field of optics has evolved considerably, especially along the lines of quantum theory. The present volume tells the story of this evolution and constitutes an important analysis of basic optical phenomena by means of the newly developed techniques.

Second Edition

Atomic Spectra

By **H. G. Kuhn**
Balliol College
Oxford, England

The second edition of this classic work treats in an elementary way the fundamental ideas and scope of atomic beam resonance, double resonance, level crossing and optical pumping. Other changes include sections on highly excited states and auto ionisation, isotope shifts and widths of spectral lines.

This is essential background material for undergraduate students in mathematics and physics and a valuable reference source for researchers in physics, chemistry and astronomy.

CONTENTS:

INTRODUCTION
THEORETICAL METHODS
THE SIMPLE SPECTRA
PERIODIC TABLE AND X-RAY SPECTRA
COMPLEX SPECTRA
HYPERFINE STRUCTURE AND ISOTOPE SHIFT
WIDTH AND SHAPE OF SPECTRAL LINES
APPENDIX
BIBLIOGRAPHY—AUTHOR INDEX—SUBJECT INDEX.
